Additional Information about our PP:

Our Nicky's Folders are made of polypropylene <pp> (virgin content only – no recycle content used) and is one of the most stable and human friendly plastics we have. PP is archival safe from leaching print from photos or printed materials and once in its solid form does not breakdown easily for decades. Once pp is in its solid state it stays that way unless it is properly recycled.

So proper recycling is important, PP has a recycle symbol of a #5; 

Polypropylene is a plastic that's used to make everything from rugs to sour cream containers. It's generally considered to be one of the safer plastics. The FDA has approved its use as a food container material, and there are no known cancer-causing effects associated with polypropylene.

Does polypropylene contain BPA?

The reason that the toxicity of polypropylene is lower than other plastics is because it doesn't contain bisphenol A, more commonly called BPA. BPA is a synthetic estrogen used in plastics that are rigid versus being more flexible like polypropylene.

Some plastics, like those that contain BPA or other harmful chemicals, can negatively affect our bodies or the world we live in. Polypropylene, a complex plastic, is generally considered safe for humans.

See me with any further questions or concerns and I will get them addressed.

Thank you,

Terry Downey – GM
